*White cells and platelets in blood transfusion Jan 17 2020
As a clinical discipline blood transfusion encompasses enormous vista, varying from biotechnology to molecular biology, from plasma products, cell biology and growth factors to interleukines. Growth of knowledge in this field has been rapid, and expertise is now required to be mastered and renewed in translating these ideas for patient care. Various types of cells could be harvested - progenitor stem cells derived from bone marrow or from circulating blood as a source for transplants; in the hemostatic armoury platelets could be used prophylactically; granulocytes and mononuclear cells are available for treatment of infections or immune modulations. However, their therapeutic use carries potential complications including graft versus host disease and CMV-infection. Prevention of such complications by irradiation and by removal of immunocompetent leukocytes are important issues. Thus, production of such therapeutic materials ought to address the issues at the earliest, to eliminate those problems while adhering to the concept of high quality; the impact of storing platelets for longer periods by using improved plastic containers or storing almost indefinitely in frozen state should be explored. Rapid progress in cell culture techniques and biotechnology have enriched the transfusion medicine armoury with lymphokines, interferons and cell colony growth factors which have great potentials for*

enhancement of basic knowledge as well as considerable therapeutic applications in patients.

*Handbook of Transfusion Medicine Jan 21 2023 Handbook of Transfusion Medicine is unique in that it provides a comprehensive and practical description of all blood products and blood cell types currently used in transfusions, their appropriate applications, pathophysiology of conditions managed by transfusion, and pathophysiology of adverse reactions. Each chapter follows a standard format including numerous tables and algorithms, with summary elements highlighted throughout by a second-color for quick reference. Sections Include: * Blood collection and testing * Blood component description * Preparation and usage * Red blood cell*

*antigens and antibodies * Specialized component processing * Specialized transfusion situations * Transfusion-transmitted diseases * Transfusion reactions * Infectious complications of transfusion * Therapeutic apheresis and quality * Acute bleeding and massive transfusion * Transfusion of the patient with a coagulopathy * Transfusion of obstetrics, pediatric, immunocompromised, and platelet refractory patients * Up-to-date references to all aspects of transfusion medicine*

Amazing Blood Sep 17 2022 Explores the role of blood in the human circulatory system, blood types, transfusions, and how to become a blood donor. Suggested level: secondary.

Blood Banking and Transfusion Medicine Mar 19 2020 Ever since the discovery of blood types early in the last century, transfusion medicine has evolved at a breakneck pace. This second edition of Blood Banking and Transfusion Medicine is exactly what you need to keep up. It combines scientific foundations with today's most practical approaches to the specialty. From blood collection and storage to testing and transfusing blood components, and finally cellular engineering, you'll find coverage here that's second to none. New advances in molecular genetics and the scientific mechanisms underlying the field are also covered, with an emphasis on the clinical implications for treatment. Whether you're new

to the field or an old pro, this book belongs in your reference library. Integrates scientific foundations with clinical relevance to more clearly explain the science and its application to clinical practice. Highlights advances in the use of blood products and new methods of disease treatment while providing the most up-to-date information on these fast-moving topics Discusses current clinical controversies, providing an arena for the discussion of sensitive topics. Covers the constantly changing approaches to stem cell transplantation and brings you the latest information on this controversial topic.

Immunohematology and Transfusion Medicine Aug 24 2020 This volume is a collection of immunohematology and transfusion medicine cases, comprised of clinical vignettes and antibody panels with questions based on each case, arranged in a workbook format. The cases are based on real patient problems which are typically encountered and covers a number of common issues and challenging problems in blood banking and transfusion practice. Discussion and resolution of each case is provided in a separate answer section, including up-to-date information on pertinent advances in the field. Written by experts in the field, Immunohematology and Transfusion Medicine: A Case Study Approach provides an interactive tool to help make blood banking and transfusion medicine memorable, practical, and relevant to residents and fellows.

Comparative Transfusion Medicine Apr 12 2022 Comparative Transfusion Medicine describes the role of animals as donors in early human transfusions. Organized into 11 chapters, the book focuses on specific animal models of human hematologic diseases. After briefly

dealing with the history of transfusion in medicine, the book discusses erythrocytes, white cells, platelets, and coagulation in various animal species, and then describes specific animal models of human hematologic diseases. It then considers the progress in bone marrow transplantation by pioneering histocompatibility studies of dogs. The discussion then shifts to the preparation components and clinical veterinary transfusions. The book also presents three problems in neonatal transfusion, including the failure of passive transfer, isoerythrolysis, and immunotherapy. The concluding chapters explore the developments in human autologous transfusion, blood substitutes, and hematopoietic growth factors. The book is of great value to veterinarians involved in research or in clinical transfusions, and to physicians and other scientists using animals in research.

Nanotechnology for Hematology, Blood Transfusion, and Artificial Blood Jan 29 2021 Nanotechnology for Hematology, Blood Transfusion, and Artificial Blood outlines the fundamental design concepts and emerging applications of nanotechnology in hematology, blood transfusion and artificial blood. This book is an important reference source for materials scientists, engineers and biomedical scientists who are looking to increase their understanding of how nanotechnology can lead to more efficient blood treatments. Sections focus on how nanotechnology could offer new routes to address challenging and pressing issues facing rare blood diseases and disorders and how nanomaterials can be used as

artificial cell-like systems (compartmentalized biomimetic nanocontainers), which are especially useful in drug delivery. For artificial blood, the nanotechnological approach can fabricate artificial red blood cells, platelet substitutes, and white blood cell substitutes with their inherent enzyme and other supportive systems. In addition, nanomaterials can promote blood vessel growth and preserve red blood cells at a positive temperature. Provides information on how nanotechnology can be used to create more efficient solutions for blood transfusions and hematology treatments Explores the major nanomaterial types that are used for these treatments Assesses the major challenges of using nanomaterials hematology

Epiphany Or Sin Jun 02 2021 Epiphany or Sin Thanks to the media, recent years have seen a spike in reporting of tragic incidents from tainted blood transfusions. Blood type incompatibility is the leading cause of complications from blood transfusions. Hepatitis A, B, and C are the most common diseases from contaminated blood transfusions. Though rare, AIDS is also a possibility. Adverse reactions may result from related issues such as coagulation problems or exposure to incompatible antigens following a blood transfusion. In a soul-searching effort to find answers that led the tragic death of his mother, Elvis Slaughter, author and criminal justice expert, discovers the dark side of healthcare business practices. Epiphany or Sin is an account of Slaughter's findings during the final moments of his mother's ordeal, following tainted blood transfusions at South Shore and Columbus Hospitals in Chicago. Following a critical review of blood transfusion practices by healthcare service providers, his mother's

medical records, and thousands of blood transfusion deaths, Slaughter concludes that more is desirable-despite regulations that guide the industry, the process is complicated, and healthcare employees make mistakes- whenever mistakes happen and lead to tragic incidents, cover-ups are common. Patients and their families are often unaware of possible complications and rely on decisions made by care providers. Epiphany or Sin, which debuts on August 17, 2015, is a must-read for families and healthcare providers.

Chemistry and Biochemistry of Oxygen Therapeutics May 21 2020 Human blood performs many important functions including defence against disease and transport of biomolecules, but perhaps the most important is to carry oxygen - the fundamental biochemical fuel - and other blood gases around the cardiovascular system. Traditional therapies for the impairment of this function, or the rapid replacement of lost blood, have centred around blood transfusions. However scientists are developing chemicals (oxygen therapeutics, or "blood substitutes") which have the same oxygen-carrying capability as blood and can be used as replacements for blood transfusion or to treat diseases where oxygen transport is impaired. Chemistry and Biochemistry of Oxygen Therapeutics: From Transfusion to Artificial Blood links the underlying biochemical principles of the field with chemical and biotechnological innovations and pre-clinical development. The first part of the book deals with the chemistry, biochemistry, physiology and toxicity of oxygen, including chapters on hemoglobin reactivity and regulation; the major cellular and physiological control mechanisms of blood flow and oxygen delivery; hemoglobin and

myoglobin; nitric oxide and oxygen; and the role of reactive oxygen and nitrogen species in ischemia/reperfusion Injury. The book then discusses medical needs for oxygen supply, including acute traumatic hemorrhage and anemia; diagnosis and treatment of haemorrhages in "non-surgical" patients; management of perioperative bleeding; oxygenation in the preterm neonate; ischemia normobaric and hyperbaric oxygen therapy for ischemic stroke and other neurological conditions; and transfusion therapy in β thalassemia and sickle cell disease Finally "old" and new strategies for oxygen supply are described. These include the political, administrative and logistic issues surrounding transfusion; conscientious objection in patient blood management; causes and consequences of red cell incompatibility; biochemistry of red blood cell storage; proteomic investigations on stored red blood cells; red blood cells from stem cells; the universal red blood cell; allosteric effectors of hemoglobin; hemoglobin-based oxygen carriers; oxygen delivery by natural and artificial oxygen carriers; cross-linked and polymerized hemoglobins as potential blood substitutes; design of novel pegylated hemoglobins as oxygen carrying plasma expanders; hb octamers by introduction of surface cysteines; hemoglobin-vesicles as a cellular type hemoglobin-based oxygen carrier; animal models and oxidative biomarkers to evaluate pre-clinical safety of extracellular hemoglobins; and academia - industry collaboration in blood substitute development. Chemistry and Biochemistry of Oxygen Therapeutics: From Transfusion to Artificial Blood is an essential reference for clinicians, haematologists, medicinal chemists, biochemists, molecular biologists,

biotechnologists and blood substitute researchers.

Immunological Effects of Blood Transfusion Dec 16 2019

This concise monograph examines the novel and distinct feature of blood transfusion (BT). It critically reviews the areas of major concern to the public and scientific/medical community. Topics include: Transmission of disease(s) from the blood donor to the recipient and the transfusion-induced alloimmunization of the recipient BT-induced immunomodulatory effects, both beneficial and deleterious Beneficial effects in clinical organ transplantation and in treatment of women with unexplained recurrent abortions Adverse effects of BT in patients undergoing curative surgery for different types of cancer and in patients at risk for bacterial infections Deleterious effects of BT on enhanced tumor growth and infections in experimental animals Attempts by a number of investigators to treat autoimmune diseases by BT in humans and in experimental animals Mechanism(s) of the BT effect from various perspectives, including the component of blood, host factors, and hypotheses for beneficial and damaging effects

Blood Transfusion and Blood Components Jul 15 2022 An authoritative guide, translated from the Dutch original, to the clinically justified and safe use of specific blood components to meet specific clinical needs. Noting that blood transfusion can be a dangerous therapy, the book aims to help clinicians make transfusion decisions on the basis of the most complete and up-to-date knowledge about blood components, their clinical indications, and associated risks. The book has ten chapters presented in

two groups. Chapters in the first group describe the state-of-the-art in blood grouping and blood banking, concentrating on information relevant to safe transfusion practice. Chapters in the second group spell out the do's and don'ts of safe transfusion practice. Guidelines and advice are intended to help clinicians avoid unjustified transfusions, know when transfusion is clearly indicated, and then select the correct transfusion material with the correct component from the correct donor. Other chapters cover the prevention of transfusion reactions and the prevention of transfusion-transmissible disease. The remaining chapters provide a model transfusion policy for the emergency management of acute massive blood loss, and outline procedures for the use of exchange transfusion to treat haemolytic disease of the newborn.

Essential Guide to Blood Groups Nov 19 2022 A short, up-to-date text on blood groups, for people working or training in the field of blood transfusion, transplantation, or human genetics, but who are not specialising in the field of blood groups, the third edition of Essential Guide to Blood Groups is a pocket-sized book, containing full colour text together with schematic figures and tables. The book comprises an introduction to blood groups, followed by chapters on techniques, information on various blood groups, antibodies, quality assurance in immunohaematology, and it concludes with chapters on troubleshooting in the laboratory, and FAQs. It also covers the serology, inheritance, biochemistry and molecular genetics of the most important blood group systems.

The Computer and Blood Banking Mar 31 2021 In the autumn of 1980, the decision was made by the responsible bodies of the German Society for Medical Documentation, Informatics and Statistics (Deutsche Gesellschaft für Medizinische Dokumentation, Informatik und Statistik e.V.) to make the application of computers in blood banking and blood transfusion one of the topics to be treated at the 8th spring conference of this Society, which was then arranged to take place in Tübingen from April 9-11, 1981. The goal of the conference was to unite application specialists and methodologists in order to assess current achievements and identify fields needing further improvement. We were fortunate to obtain the interest of the German Society for Blood Transfusion and Immunohaematology D. Roos, the head of the EDP Work study group of the Section 1 of this Society did substantially influence the programme. Many of the papers actually reflect accomplishments of his research and of the work study group. We also consider ourselves fortunate to win Prof. C. Mueller-Eckhardt, current president of this Society, to give an introductory address.

Managing Hazards in the Transfusion Service Oct 14 2019 This volume examines the wide range of hazards associated with blood transfusion and outlines steps that laboratory professionals can take to minimize these risks. Close attention is given to transfusion-transmissible infections, as well as to complications of autologous and

apheresis donation and considerations for storage of such donated blood components. The authors discuss problems associated with immunologic recognition of blood products, such as immune red cell destruction, granulocytic febrile reactions, allergic reactions caused by plasma proteins, incompatibility and sensitization to transfusion, and immunosuppressant effects. The book also offers guidelines for handling complications arising from transfusion to patients with carcinoma and other underlying conditions.

Circulating Life Mar 11 2022 A history of the art of transfusions and a scientific discourse on the chemistry of blood.

Transfusion Medicine Oct 06 2021 Transfusion Medicine: A Clinical Guide is a concise, patient-focused handbook that guides physicians in the art of blood transfusion. The book begins with a clear explanation of the simple task of ordering blood, something many physicians have never learned. The next four chapters describe evidence-based transfusion for the common patient types across the specialties. Following this are four chapters devoted to special patient groups, including obstetric, pediatric, and neonatal, each with a thorough discussion of the management of frequently encountered problems. The book concludes with a synopsis of transfusion reactions, emphasizing the role of the physician at the bedside. This handbook balances bullet-form text boxes with prose paragraphs to provide the physician with real-world advice for real patients, and also full treatment of underlying medical principles for real understanding of real patient issues.

The Effects Of Multidisciplinary Team Approach On Blood And Blood Products Transfusion Jun 21 2020 Background and aims: The Joint Commission and the American Medical Association-Convened Physician Consortium for Performance Improvement reported that the blood transfusions are among the top 5 overused treatments in modern medicine. Optimal management of blood transfusion is one of the most important factors that increase patient safety and special education is increasing all over the world in this regard. In our hospital, it is aimed to decrease the perioperative transfusion amount by multidisciplinary team approach. In this regard, a

commission has been established in which anesthesiologist, intensivist, cardiovascular surgeon, blood bank unit and hospital administrators are involved. By organizing monthly regular meetings we try to develop new strategies. Our goal in this retrospective cohort study is to investigate the effects of periodic consensus meetings and trainings on perioperative blood transfusion by a team of different branches of medicine.

Materials and Methods: Following the Ethics Committee approval, between 2014 and 2016, patients over the age of 18 who underwent cardiac surgery and had blood transfusion were included in this study. The transfusions were calculated cumulatively, the change with respect to years was determined, as well as side effects and complications associated with transfusion. Patients' cardiac reserves, preoperative and postoperative laboratory values, anticoagulant drug use frequency, transfused blood volume, complications and mortality rates were recorded. The types of surgery, reexploration rate, length of intensive care and hospital stay were recorded.

Results and discussion: Patients' age, BMI, EF value, COPD, DM, HT ratio, antimicrobial drug use did not differ between the years 2014, 2015 and 2016 ($p > 0.05$). The length of intensive care and hospital stay, amount of bleeding, mortality rate did not differ ($p > 0.05$). CBP and CX time in 2016, were significantly higher ($p < 0.05$) than in 2014 and 2015 (Table 2). The amount of RBC, FFP, platelet, cryoprecipitate did not differ significantly ($p > 0.05$). Besides after 2014, an increase in the use of platelets was observed. The change in Hb, Htc, platelet and INR did not differ significantly ($p > 0.05$) in the pre-postoperative period.

Conclusions: Training on the

restrictive use of blood products did not have a positive influence on blood transfusion in our study. It has been demonstrated that there are challenges in sufficiently transferring the knowledge to the clinical environment.

Transfusion Medicine Aug 16 2022 The Diagnostic Standards of Care series presents common errors associated with diagnoses in clinical pathology, using case examples to illustrate effective analysis based on current evidence and standards. In addition to being a practical diagnostic guide, each volume demonstrates the use of quality assurance and the role of the pathologist in ensuring quality and patient safety. Transfusion Medicine addresses common issues and errors seen in the blood transfusion process. The goal is to alert general practitioners and trainees to the latest scientific advances and spiraling regulations in blood transfusion as well as introduce them to the most common types of transfusion errors encountered in clinical settings. Transfusion Medicine features: Descriptions of potential errors in regulatory compliance, operational processes, and patient safety Descriptions of potential errors in clinical decision making in blood transfusion, including when to premedicate patients, warfarin reversal, and the diagnostic intricacies in TRALI and TTP Pocket-sized for portability

Immuno-hematology and Transfusion Medicine Nov 07 2021 The latest edition of this volume features an extensively revised and expanded collection of immuno-hematology and transfusion medicine cases, comprised of clinical vignettes and antibody panels with questions based on each case. Arranged in a workbook format, the text presents cases based on real patient

problems that are typically encountered and covers a number of common issues and challenging problems in blood banking and transfusion practice. Discussion and resolution of each case is provided in a separate answer section, including up-to-date information on pertinent advances in the field. This second edition also contains new cases on topics not previously covered, including types of compatibility testing, polyagglutination, hematopoietic stem cell transplantation, immunohematology test drug interference, granulocyte transfusion, heparin-induced thrombocytopenia, and the approach to the bloodless patient. Written by experts in the field, Immunohematology and Transfusion Medicine: A Case Study Approach, Second Edition provides an interactive tool that makes blood banking and transfusion medicine memorable, practical, and relevant to residents and fellows.

The Epidemiology of Multiple Blood Component

Transfusion Feb 10 2022 Multicomponent transfusion, or the transfusion of two or more different blood products, has been poorly studied to date, as most of the existing literature has focused on the use of individual blood products. This is of concern as multicomponent transfusion recipients likely differ with respect to characteristics and health outcomes from patients transfused with only one type of blood component (e.g. greater illness severity). Consequently, available data on individual blood product use and outcomes may not be applicable to multicomponent transfused patients. This thesis project identified and synthesized existing literature

on the epidemiology of multicomponent transfusion in hospital inpatients, as well as the characteristics and outcomes of its recipients. Based on 37 observational studies, we found that the prevalence of multicomponent transfusion varied greatly by patient population, transfusion timeframe, and type of multicomponent transfusion being studied. The most common types of multicomponent transfusion across the 37 studies were co-transfusions of red blood cells (RBCs) and platelets, and co-transfusions of RBCs and plasma. Multicomponent transfusion was found to be associated with several negative health outcomes, however this was based on low quality evidence due to lack of control for confounding by indication. Our systematic review on multicomponent transfusion identified several knowledge gaps, including the need for studies focusing on patients with hematological malignancies, and studies identifying patient characteristics predictive of multicomponent transfusion. To address areas of knowledge deficiency, and to characterize multicomponent transfusion locally at our own center, we designed and conducted a retrospective cohort study of adult, transfused hospital inpatients. Based on 55,719 transfused inpatient admissions at the Ottawa Hospital between 2007 and 2017, we calculated the overall prevalence of multicomponent transfusion to be 25.1% (95% CI: 24.7%, 25.5%). Similar to the findings of our systematic review, the prevalence varied greatly by patient type, transfusion timeframe, and type of multicomponent transfusion. In particular, in hematology patients, the prevalence of multicomponent transfusion was 51%. Other patient groups frequently receiving multicomponent transfusions

at our institution were cardiac surgery, critical care, cardiology, vascular surgery, trauma, surgery, and internal medicine patients. Using multivariable regression analysis, we found that patient sex, age, and type were predictive of multicomponent transfusion requirement. Additionally, controlling for illness severity and burden, multicomponent transfusion was associated with increased odds of in-hospital mortality, institutional discharge compared to discharge home, and greater length of hospital stay compared to patients transfused with only RBCs. Given our findings that multicomponent transfusion recipients make up a large proportion of transfused hospital patients, and that they have poorer outcomes, it is of importance to continue characterizing these patients - and not only focus on patients receiving a single type of blood component - and to evaluate and monitor the appropriateness of multicomponent transfusion. Additionally, as transfusion practice and guidelines are known to vary from region to region, it is important to study multicomponent transfusion locally, as generalizing results from other studies and centers may not be appropriate. Obtaining robust information on multicomponent transfusion - including prevalence, predictors, and potential health consequences - can aid clinicians in their decision-making for patient blood management, potentially minimizing unnecessary patient exposure to blood products, and maximizing the use of transfusion alternatives and blood conservation methods.
