Magnetite in Muscovite Mica; Asbestos or Amphibole and Pyrite

in Quartz and Calcite. We also find small cavities filled with water, solutions of salts, hydrocarbon compounds, and liquid or gaseous carbon dioxide. The Quartz crystals in 9. Granite at Branchville, Conn., contain so much liquid carbon dioxide that they are said to explode with considerable noise when broken. Many Topazes also contain the same substance. It is also quite common to find glassy inclusions in the minerals found in some lavas, as Leucite in some of the Italian rocks. The use of the microscope in the examination of thin sections of rocks has shown how common all these different kinds of inclusions are. Minerals, then, have their homogeneity locally disturbed by all such inclusions as have been mentioned; but if we consider the mineral apart from the inclusion, it is homogeneous. Theoretically it is possible to separate these inclusions from the parent mineral, but practically, on account of the microscopic fineness to which they are sometimes reduced, the feat is often impossible. However, we may disregard such slight disturbances of homogeneity and consider the substance as a mineral, though in reality it is a mineral aggregate. If we use the word mineral in the most exclusive manner, then all inorganic secretions and concretions which have been made by animals or vegetables are not to be classed as minerals. Examples of such substances of animal origin would be corals, shells, and bones; while coal, amber, and infusorial earth represent the vegetable kingdom. Neither are artificial inorganic substances made by man in his laboratory to be considered as minerals; so that all these facts show us that there are many inorganic substances which do not come within the province of Mineralogy, which is a branch of Inorganography, if I may coin a word which is used in other languages but not in English, which therefore is a more comprehensive subject than Mineralogy. *The Mechanisms of the Electrochemical Reactions of Simple Organic Compounds in Aqueous Solutions* Jun 21 2020 Research to further the understanding of the anode of a hydrocarbon fuel cell is reported. Studies of simple organic reactions, e.g., the reduction of CO<sub>2</sub>, the oxidation of HCOOH, and the effects of adsorbed layers on their reactions in acid solutions are reported. Methods of determining the properties of adsorbate layers are experimentally and theoretically explored. Methods to allow determination of double layer charging effects and electrode oxidation corrections are developed. Studies of the Pt electrocatalytic surface show it to be markedly heterogeneous. Studies of the formation of 'reduced CO<sub>2</sub>', the main intermediate in hydrocarbon oxidation, have been carried out. The mechanism of HCOOH oxidation has been explored. It has been shown that the product of a side reaction blocks the electrode and inhibits the desired reaction. The electroactive species is apparently HCOO(-). The effects of adsorbed inorganic layers on HCOOH oxidation have been studied with a view to developing a non-noble metal catalyst stabilized by adsorption. Experiments with Cu, Ag, Pb, Hg, S, and Cl(-) are reported. The most reactive layers are Pb, Hg, and S. (Author).

**The Names and Structures of Organic Compounds** May 21 2020  
*Plant Enhanced Biodegradation of Petroleum Hydrocarbons in Soil* Feb 16 2020 Hydrocarbons in soil may assert acute or chronic impacts to plants, animals and microbial processes if contacted. These have raised political and scientific concerns. Consequential research efforts corroborated that constitutive microorganisms contact the compounds for their metabolic activities. This may result in mineralisation, transformation and/or detoxification (biodegradation) of the compounds. Hydrocarbon biodegradation is relatively cost-effective and ecological, but often marred with limited availability to plant or animal cells (bioavailability) for metabolism. Several authors reported that growth of some plants or administration of requisite rootexudates into soil with hydrocarbons often increases hydrocarbon bioavailability for enhanced biodegradation. However, development of knowledge about this respite from plants is often founded on impacts of plants on single dose or selected mixture of hydrocarbons in soils or culture solutions. These do not; and cannot represent the heterogeneous complex mixture of numerous organic and inorganic compounds in soils where plants grow naturally. In this study, synthetic root-exudates, seedlings of lupin and ryegrass were applied separately into respective soils that were

contaminated with aged and/or fresh petroleum hydrocarbons. Individual impacts of the treatments on bulk hydrocarbon concentrations, rate of microbial respiration and total numbers of culturable bacterial colonies in the soils were investigated. Results suggested that application of lupin, ryegrass or synthetic root-exudates into the soils significantly ( $p \leq 0.05$ ) induced reduction or upsurge of hydrocarbon biodegradation end-points relative to the type and concentration of hydrocarbons in soil. Thus, it is inferred that growth of plants or administration of root-exudates into hydrocarbon contaminated soils could result in enhanced biodegradation of hydrocarbons in soil.

alkalies are chemical opposites. The amount of acid or alkali in solution is determined by titration. The pH value of a solution shows the amount of active acid or active alkali present. The pH value of a solution can be determined colorimetrically. The pH value of a solution can be determined electrometrically. Salts are common substances. Oxidation is accompanied by reduction. Volume 2: Chlorine is an active nonmetal. Fluorine, chlorine, bromine and iodine are halogens. Sulfur forms many types of compounds. Nitrogen compounds are a part of all living matter. Phosphorus may make food or poison. Carbon forms oxides of carbon and carbonic acid. The oxide of silicon in sand. Metals are conveniently arranged in an electromotive series. Sodium is the leading alkali metal. Potassium is much like sodium. Ammonium compounds resemble those of alkali metals. Barium, strontium and calcium are alkaline earth metals. Magnesium is a light metal. Aluminum comes from bauxite. Zinc forms the only white sulfide. Chromium is a serviceable plating material. Iron and steel are basic constructional materials. Nickel is used mainly in alloys. Tin is highly malleable. Lead forms useful oxides. Arsenic and antimony, metals or nonmetals? Copper is a good conductor of electricity. Mercury is the only liquid metal. Silver is classed with the precious metals. Platinum is nonreactive. Gold has to be alloyed to make it useful. Radioactive elements change automatically into different elements. Colloids are submicroscopic. Volume 3: Part I: Aliohatic compounds: Organic chemistry deals with hydrocarbons and their beginning of a homologous series. Unsaturated compounds contain double or triple bonds. Hydrocarbons form halogen derivatives. Alcohols contain the hydroxyl group. Aldehydes and ketones contain a carbonyl group. Acids contain the carboxyl group. Esters are like organic salts with an alkyl group in place of a metal. Ethers are oxides with hydrocarbon radicals. Amines and amides are organic derivatives of ammonia. Alkyl cyanides and cyano compounds contain the nitrile group. Many sulfur compounds have a bad odor. Acetoacetic ester has two forms, or is tautomeric. Some hydroxy acids are optically active. Carbohydrates are compounds of carbon, hydrogen and oxygen. Part II: Aromatic compounds: The simplest cyclic hydrocarbon is benzene.

Benzene forms halogen derivatives and alcohols. Toluene and xylene are alkyl derivatives of benzene. Nitro compounds contain the-NO<sub>2</sub> group. Amines contain the-NH<sub>2</sub> group. Azo dyes are prepared with the aid of diazonium salts. Cyclic carbonyl compounds include aldehydes, ketones and quinones. Cyclic acids carry a carboxyl group on the nucleus. Phenols carry a hydroxyl group on the nucleus. Many cyclic compounds have complex structures. Ethers are nonreactive. Naphthalene is a double ring compounds. Anthracene and anthraquinone contain three rings. Many compounds contain atoms other than carbon in the ring. Proteins contain amino acids. Vitamins are essential food elements. Volume 4: Inorganic acids. Bases or alkalies. Sodium salts of inorganic acids. Potassium salts of inorganic acids. Sodium and potassium salts of organic acids. Ammonium and lithium compounds. Calcium compounds. Barium, strontium and magnesium compounds. Compounds of nickel, cobalt, manganese and zinc. Compounds of aluminum, chromium and iron. Arsenic, antimony and tin. Copper, cadmium and bismuth. Lead, silver, gold and mercury. Miscellaneous metals and compounds. Carbon and miscellaneous nonmetals with their oxides and related compounds. Hydrocarbons, other than those from petroleum, and their simple halogen derivatives. Petroleum hydrocarbons and related products. Alcohols. Phenols and their derivatives. Aldehydes and ketones and their derivatives. Organic acids and closely related compounds. Amines, nitro compounds, and various organic nitrogen derivatives. Esters. Fats and fatty oils. Waxes. Ethers. Organic dyes. Toners, lakes and reduced colors. Natural plant products.

**Restoration of Contaminated Aquifers** Jul 15 2022 The second edition of Restoration of Contaminated Aquifers: Petroleum Hydrocarbons and Organic Compounds incorporates the latest advances in in-situ remediation and natural attenuation, and maintains the comprehensive, accessible structure that made the first edition a classic. The new edition broadens the scope of the first by examining all forms of hydrocarbon contamination. The authors emphasize the remediation of Non-aqueous Phase Liquids (NAPLs) and, Dense Non-Aqueous Phase Liquids (DNAPLs). They also address the growing role of natural attenuation. The

second edition opens with an improved introduction. There are new sections on site characterization, remediation economics and site closure. And unlike other books on this subject, the new edition offers vital managerial and project management guidance, such as, initial project planning and assessment, a look at remediation economics, and a how-to on project closure and follow-up. Since its initial publication in 1991, Restoration of Petroleum Hydrocarbon Contaminated Aquifers has been the established, invaluable reference for environmental professionals and regulators. Its sweeping, yet approachable format is inestimable in the field, in the lab, and in the policy-making arena. Restoration of Contaminated Aquifers: Petroleum Hydrocarbons and Organic Compounds will continue to be the guide to the war against petroleum contamination.
