Modeling and Simulation with Optimal Gear Ratio for a Forward-looking, Velocity-driven, Power-split Hybrid Electric Vehicle Nov 26 2020

Increases in vehicle demand and fossil fuel consumption are major contributors to environmental problems, such as air pollution and climate change. This has led to research on alternative, energy-efficient vehicle technologies. Automobile users are now preferring comfortable vehicles with minimal fuel consumption and with more efficient engines. Hybrid cars are becoming common because of their advantage of running cleaner and with better gas mileage. A hybrid car runs on the power of both an electric motor and a gasoline engine. This mechanism helps cut fuel consumption and conserve energy. An additional advantage is a regenerative braking system that helps recharge the battery, which ultimately reduces load on the engine and hence produce lower emissions. In this thesis, components of hybrid electric vehicles are defined and a computational model of a typical hybrid system is developed. Modeling and simulation of these components is done in the Matlab/Simulink environment. This thesis underscores the HEV model that can be used in future and the importance of optimized powertrain components, especially the planetary gear ratio and its impact on vehicle performance and fuel economy. The planetary gear ratio ensures smooth transmission, propulsion capacity, acceleration, and fuel economy. This thesis investigates the effect of different gear ratios on fuel economy for the US06 and FTP75 drive cycles and proposes a strategy for optimizing gear ratio to maximize fuel economy without compromising vehicle drivability. The study presented in this thesis also emphasizes battery stability and optimal energy management at different gear ratios. The forward-looking, velocity-driven, power-split model developed in this study highlights the importance of gear ratio in engine operation and also ensures that generator does not overrun in the process.

101 GM Muscle Car Performance Projects Jan 21 2023 Many of the most popular cars of the muscle era came from General Motors. Spread across the General's various marques were models like the Camaro, Chevelle, GTO, Cutlass, Skylark, Tempest, Impala, Monte Carlo, El Camino, and many others. This book will provide 101 hands-on, how-to projects aimed directly at fans of classic GM muscle, showing them how to do just the kinds of projects that they want to do: restoration of the exterior and interior, and performance upgrades to the engine, driveline, and suspension. The existence of many large aftermarket companies provides evidence of the vast potential audience for this book. Restoration and performance part companies like Year One, National Parts Depot, Summit Racing, Jegs, and Original Parts Group count on this audience to provide a large portion of their business. For example, Original Parts Group, which specializes exclusively in parts for GM A-body muscle cars, sells an average of \$100,000 worth of parts each day. Primedia alone has six magazines that serve this crowd (Hot Rod, Car Craft, Chevy High Performance, High Performance Pontiac, Popular Hot Rodding, Super Chevy) with a combined circulation of 1.7 million readers per month. Like the 101 series books before it, this book provides an immense quantity of do-it-yourself projects that are accessible to

the at-home mechanic who has a good set of hand tools and a place to work. Procedures will be performed on specific GM cars of this era, which differed more in sheetmetal and trim than in the functional components, which were often similar or identical from car to car.
