*The conference was held online. This book brings together, for the first time, two very powerful concepts: customer value and competitive planning. Together they create a powerful tool that will generate breakthrough strategies for market dominance. The previously fashionable metrics of customer satisfaction have proven to be poor predictors of business performance, whereas the linkages between customer value and performance measures such as market share and profitability have been identified and documented. Value has been shown to be one of the best predictors of market share and customer loyalty available. Developing a system to harness value as a competitive weapon is an essential next step. Competing with Customers presents a competitive planning template that enables organizations to actually harness their value creation and delivery systems to enhance their market performance. It is a planning system that focuses at the level where the organization makes money: selling products or services to people in specific markets or market segments. Readers will discover a clear blueprint for crafting breakthrough, value-added strategies. For many readers, it will challenge the way they look at their competition, their markets, and their industries. Competition will never look the same.!

Artificial intelligence (AI) is viewed as one of the technological advances that will reshape modern societies and their relations. While the design and deployment of systems that continually adapt hold the promise of far-reaching, positive change, they simultaneously pose significant risks, especially to already vulnerable people. This work explores the meaning of AI, and the important role of critical understanding and its phenomenological foundation in shaping its ongoing advances. The values, power, and magic of reason are central to this discussion. Critical theory has used historical hindsight to explain the patterns of power that shape our intellectual, political, economic, and social worlds, and the discourse on AI that surrounds these worlds. The authors also delve into niche topics in philosophy such as transcendental self-awareness, post-humanism, and concepts of space-time and computer logic. By embedding a critical phenomenological orientation within their technical practices, AI communities can develop foresight and tactics that can better align research and technology development with established ethical principles — centering vulnerable people who continue to bear the brunt of the negative impacts of innovation and scientific progress. The creation of a critical – technical practice of AI will lead to a permanent revolution in social, scientific, and political communities. The years ahead will usher in a wave of new scientific breakthroughs and technologies driven by AI research, making it incumbent upon AI communities to strengthen the social contract through ethical foresight, a capability which

only phenomenology can deliver, ultimately supporting future technologies that enable greater well-being, with the goal of delivering practical truths. *A Critical Understanding of Artificial Intelligence: A Phenomenological Foundation* is an essential read for anyone interested in the complex debate and phenomenology surrounding AI and its growing role in our society. *Nuclear Decommissioning Case Studies: Accidental Impacts on Workers, the Environment and the Public, Volume One* presents a collection of international case studies that show impacts on workers, the public and the environment. Author Michele Laraia describes typical stages of decommissioning, such as categorization, hazard and risk analysis, and the risks and impacts involved at each stage. Each case is introduced before discussing its impacts, solutions, analysis, and lessons learned. This book uniquely collects, categorizes and compares radiological and non-radiological accidents, incidents and near misses which will be of great value to practitioners in industry and authorities developing nuclear programs. Finally, this book instructs readers on important prevention, mitigation and control measures to create sustainable, safe nuclear facilities. Includes various case studies and analyses on the impact of nuclear decommissioning on environmental sustainability, workers and the public Highlights the need of ensuring sustainability plans at the beginning of a nuclear project and informs decision makers on how to select the best options Guides the reader through a systematic analysis of the likelihood of incidents and how to take measures against them The consideration of human factors issues is vital to the mining industry. As in other safety-critical domains, human performance problems constitute a significant threat to system safety, making the study of human factors an important field for improving safety in mining operations. The primary purpose of this book is to provide the reader with a much-needed overview of human factors within the mining industry, in particular to understand the role of human error in mine safety, explaining contemporary risk management and safety systems approaches. The approach taken is multidisciplinary and holistic, based on a model of the systems of work in the mining industry domain. The ingredients in this model include individual operators, groups/teams, technology/equipment, work organisation and the physical environment. Throughout the book, topics such as human error and safety management are covered through the use of real examples and case studies, allowing the reader to see the practical significance of the material presented while making the text rigorous, useful and enjoyable. *Understanding Human Error in Mine Safety* is written for professionals in the field, researchers and students of mining engineering, safety or human factors. The two volume set LNCS 12506 and 12507 constitutes the proceedings of the 19th International Semantic Web Conference, ISWC 2020, which was planned to take place in Athens, Greece, during November 2-6, 2020. The conference changed to a virtual format due to the COVID-19 pandemic. The papers included in this volume deal with the latest advances in fundamental research, innovative technology, and applications of the Semantic Web, linked data, knowledge graphs, and knowledge processing on the Web. More than 3 million persons reside in Maricopa County, Arizona, one of the fastest growing urban areas in the country. The urbanized portion of the county has been designated a nonattainment area for PM10, by the U.S. Environmental Protection Agency for levels of particulate matter that exceed the National Ambient Air Quality Standards. In response, Maricopa County has enacted Rule 310 that contains measures to mitigate the generation of fugitive dust. Construction activities are estimated to generate nearly 40% of airborne particulates in the area. The Arizona Department of Transportation contracted with Lima & Associates and Cathy D. Arthur to develop an educational outreach program with the purpose of training construction industry personnel on the importance of controlling fugitive dust and the methods of so doing. This report summarizes the background leading up to the enactment of Rule 310 and the subsequent development of the outreach program. Elements of the program are described, and an implementation plan is provided. This report is accompanied by appendices that contain prototype elements of the training program that have been developed. These prototypes are intended to illustrate the results of the research only, and are not current training instruments.
